Review of the course

Rings and Ideals

- Know the definitions:
  - ring, commutative, identity, field;
  - unit, zero divisor, characteristic;
  - homomorphism, isomorphism.
- Know how to:
  - Prove that a subset of a ring is a subring, or an ideal (or show that it isn't).
  - Prove that a function is a homomorphism, or isomorphism (or show it isn't).
  - Show that two rings can't be isomorphic, because they have some different structure.
  - Identify the units and zero divisors in a ring.
- Know how to construct new rings from old and to compute in these rings.
  - The Cartesian product of rings R and S is a ring $R \times S$.
  - The 2×2 matrices over a ring R form a ring, which we write $M(R)$.
  - We also have the polynomial ring, $R[x]$ over a ring R.
- Know how to work with quotient rings. (Here you may assume the ring is commutative with identity.)
  - If I is an ideal in R, the elements of R/I are written $a + I$ where $a \in R$.
  - $a + I = b + I$ when $a - b \in I$.
  - Addition in R/I is defined by $(a + I) + (b + I) = (a + b) + I$.
  - Multiplication in R/I is defined by $(a + I)(b + I) = (ab) + I$.
  - I is prime if and only if R/I is an integral domain.
- Know the special properties of $\mathbb{Z}$ and $F[x]$.
  - Division theorem.
  - Euclidean algorithm.
  - Prime iff irreducible.
  - Unique factorization.
  - Every nonzero element is either a zero divisor or a unit.
  - In $F[x]$, $(x - a)$ is a factor of $f(x)$ iff a is a root of $f(x)$.
  - Know what the ideals are in $\mathbb{Z}$, $\mathbb{Z}_n$, $F[x]$ and $F[x]/a(x)$.

Groups

- Definitions
  - group, subgroup, cyclic subgroup, abelian group;
  - order of a group, order of an element;
  - homomorphism, isomorphism.
- Standard examples
  - The additive group of a ring.
  - The group of units in a ring.
  - U_n the group of units in $\mathbb{Z}_n$.
  - $Gl(2,F)$, the group of invertible 2×2 matrices over a field F.
  - $Sl(2,F)$, the group 2×2 matrices over a field F that have determinant 1.
  - D_n, the group of symmetries of a regular polygon
  - S_n the group of permutations of n objects.

Have a look at the last two exams and the last couple of problem sets. Here are a few extra problems:

1. Let I and J be ideals in a ring R (commutative with identity).
   (a) What is $I + J$?
   (b) Show that $I + J$ is an ideal.
2. Express in the simplest form.
   $\langle x^2 - 1\rangle + \langle x^2 + 2x + 1\rangle$ in $\mathbb{Q}[x]$.
   $\langle x^2 - 1\rangle \cap \langle x^2 + 2x + 1\rangle$ in $\mathbb{Q}[x]$.
   $\langle x^2 - 1\rangle + \langle x^2 + 2x + 1\rangle$ in $\mathbb{Q}[x]/(x^3 - 1)$.
   $\langle x^2 - 1\rangle \cap \langle x^2 + 2x + 1\rangle$ in $\mathbb{Q}[x]/(x^3 - 1)$.
4. Show that the function $\phi : \mathbb{Q}[x] \to \mathbb{Q}$ defined by $\phi(f(x)) = f(2)$ is a homomorphim. (If $f(x) = \sum_{i=1}^{n} f_i x^i$ then $f(2) = \sum_{i=1}^{n} f_i 2^i$.)
   What is the kernel of ϕ?

Identify an ismorphism between $Gl(2, \mathbb{Z}_2)$ and S_3. How many isomorphisms are there? List all the subgroups of S_3

5. Show that the set of 2×2 matrices with determinant ± 1 is a subgroup of $Gl(2,F)$.
6. Show that U_{11} is a cyclic group, generated by 2.
